During the process of creating this website, I utilized ChatGPT to streamline certain aspects of the development process. Using the AI's capabilities, I was able to efficiently generate code snippets for creating this code, specifically for creating containers and helping with the actual array creation. I had also asked it questions on why something was done a certain way to help enhance my learning process during this assignment. This approach significantly helped me in the initial stages of development, allowing me to focus more on creating a better end product while not wanting to cry while doing it!

However, while ChatGPT proved great code snippets and providing guidance on technical aspects that I did not understand, I do not think it could have done this whole project alone without ChatGPT's help or another person. I turned to it a lot to explain to me how a function worked so I could better write my code around what I wanted to do! I created a very simple structure of this assignment but im happy with how it turned out!
